

SC Assignment 1

Name: Dipean Dasgupta

ID: 202151188

BASED ON SOME EXAMPLES COMPARE (SIMILARITIES AND DIFFERENCES) BETWEEN THE ECOLOGICAL CONFLICTS IN THE DEVELOPED AND DEVELOPING COUNTRIES.

When it comes to the matter of environment, both developed and developing countries have their own ecological conflicts that are having notable impact on environment. In some cases, countries of both types are dealing with same types of conflicts and different types in other cases. Here we are going to compare the ecological conflicts that developed and developing countries are dealing with.

Among the differences, first major difference between ecological conflicts in developed and developing countries is the level of industrialization. Developed countries tend to have more advanced and polluting industries, while developing countries are often still reliant on agriculture. This difference can lead to developed countries having a greater impact on the environment, both in terms of pollution and habitat destruction.

Another difference is the level of economic development. Developed countries tend to be wealthier and have a higher standard of living, while developing countries are often poorer. This can impact the way ecological conflicts are addressed, as developed countries may be able to afford more expensive solutions such as technology to mitigate environmental damage, while developing countries may be more focused on subsistence.

Finally, developed and developing countries often have different levels of political stability. Developed countries tend to be more stable, while developing countries may be more prone to conflict and upheaval. This can impact the way ecological conflicts are addressed, as developed countries may be able to negotiate and implement more effective policies, while developing countries may be more likely to experience violence and unrest.
