TUTORIAL 7

1. Derive PDF of 1^{st} , n^{th} and k^{th} order statistics for X_1, X_2, \dots, X_n i.i.d Random variables.
2. A fair coin is tossed 100 times. Estimate the probability that the number of heads is between 40 and 60.
3. A fair die is tossed 20 times. What is the probability that the total number of dots is between 60 and 80?
4. Let X be a Bernoulli Random variable. A probability of success is $p \in [\frac{1}{10}, \frac{1}{5}]$. Suppose that we can independently repeat the experiment as many times as we wish and use the ratio

$$\frac{\text{Success}}{\text{Total experiments}}$$

as an estimator of p . What is the minimum number of experiments needed in order to be sure that the standard deviation of the estimator is less than $1/100$?

Best wishes
