Experiment No: 2

Realization of logic functions with the help of universal gates-NAND Gate & NOR Gate.

Apparatus: logic trainer kit, NAND gates (IC 7400), NOR gates(IC 7402) wires.

Theory:

NAND gate is actually a combination of two logic gates: AND gate followed by NOT gate. So its output is a complement of the output of an AND gate.

This gate can have a minimum of two inputs, output is always one. By using only NAND gates, we can realize all logic functions: AND, OR, NOT, X-OR, X-NOR, NOR. So this gate is also called the universal gate.

NAND gates as NOT gate

A NOT produces a complement of the input. It can have only one input, tie the inputs of a NAND gate together. Now it will work as a NOT gate. Its output is

$$Y = (A.A)'$$

$$Y = (A)'$$
NOT (inverter)

NAND gates as AND gate

A NAND produces a complement of AND gate. So, if the output of a NAND gate is inverted, overall output will be that of an AND gate.

$$Y = ((A.B)^2)^2$$

$$Y = (A.B)$$

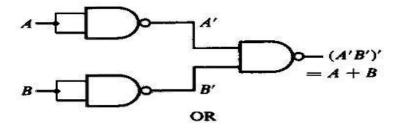

$$A \longrightarrow (AB)^2 \longrightarrow AB$$
AND

NAND gates as OR gate

From DeMorgan's theorems: (A.B)' = A' + B'

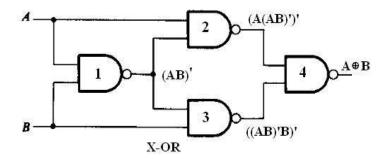

$$(A'.B')' = A'' + B'' = A + B$$

So, give the inverted inputs to a NAND gate, obtain OR operation at output.

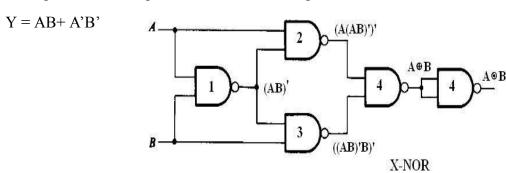

NAND gates as X-OR gate

The output of a to input X-OR gate is shown by: Y = A'B + AB'. This can be achieved with the logic diagram shown in the left side.

NAND gates as X-NOR gate

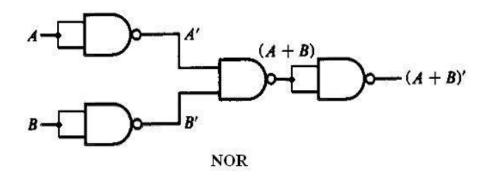

X-NOR gate is actually X-OR gate followed by NOT gate. So give the output of XOR gate to a NOT gate, overall output is that of an X-NOR gate.

NAND gates as NOR gate

A NOR gate is an OR gate followed by a NOT gate. So connect the output of OR gate to a NOT gate, overall output is that of a NOR gate.

$$Y = (A + B)$$

Theory:

NOR gate is actually a combination of two logic gates: OR gate followed by NOT gate. So its output is a complement of the output of an OR gate.

This gate can have a minimum of two inputs, output is always one. By using only NOR gates, we can realize all logic functions: AND, OR, NOT, X-OR, X-NOR, NAND. So this gate is also called the universal gate.

NOR gates as NOT gate

A NOT produces a complement of the input. It can have only one input, tie the inputs of a NOR gate together. Now it will work as a NOT gate. Its output is

$$Y = (A+A)'$$

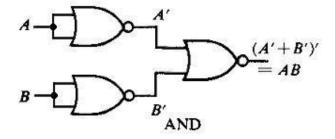

$$Y = (A)'$$

$$A \longrightarrow A'$$
NOT

NOR gates as AND gate

From DeMorgan's theorems: (A+B)' = A'B'

$$(A'+B')' = A''B'' = AB$$

NOR gates as OR gate

A NOR produces a complement of OR gate. So, if the output of a NOR gate is inverted, overall output will be that of an OR gate.

$$Y = ((A+B)')'$$

$$Y = (A+B)$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$OR$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$A \longrightarrow A$$

$$B \longrightarrow A$$

$$A \longrightarrow$$

NOR gates as X-NOR gate

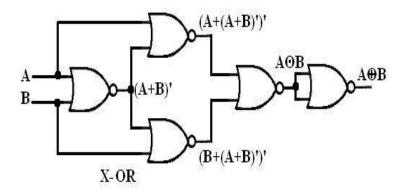

The output of a two input X-NOR gate is shown by: Y = AB + A'B'. This can be achieved with the logic diagram shown on the left side.

NOR gates as X-OR gate

X-OR gate is actually X-NOR gate followed by NOT gate. So give the output of X-NOR gate to a NOT gate, overall output is that of an X-OR gate.

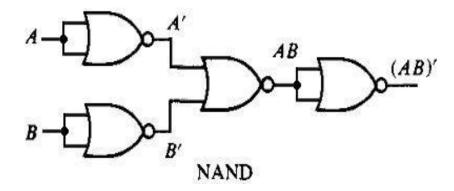

$$Y = A'B AB'$$

NOR gates as NAND gate

A NAND gate is an AND gate followed by a NOT gate. So connect the output of AND gate to a NOT gate, overall output is that of a NAND gate.

$$Y = (AB)$$

Procedure:

- 1. Connect the trainer kit to a power supply.
- 2. Connect the NOR gates for any of the logic functions to be realised.
- 3. Connect the inputs of the first stage to logic sources and output of the last gate to the logic indicator.
- 4. Apply various input combinations and observe output for each one.
- 5. Verify the truth table for each input/ output combination.
- 6. Repeat the process for all logic functions.
- 7. Switch off the ac power supply.
